

## An iPad perfect marriage with Apple

**Latest Apple sensation offers a fantastic platform for technology to provide the ultimate in Vehicle Tracking Solutions.**

London, 1st April 2010—  
Modern tech developments mean a leap forward in tracking and vehicle protection technology.

The advanced functionality of the iPad makes it easier than ever to take full advantage of the latest tracking technology.

The new system uses a simple tracking unit, an iPhone and now an iPad to allow individuals or companies get the most out of their vehicles, protect employees and schedule salespeople and engineers more efficiently.

"This active monitoring technology is a great fit with the performance capabilities of the Apple iPad," comments Director of **AutoAlert**, Richard Harris. "There are exceptional features in this such as automatic alerts, vehicle tracking, maintenance alerts,

and theft protection which are becoming increasingly popular with a broader section of the market, including families and the female sector."

The iPad's easy access functions make it simple to use the Tracking Application to send your location to the Automated Control Centre, view the location of other connected devices and get alerts if a colleague or vehicle enter or leave specific areas.

"The iPad is an excellent platform for taking advantage of these functions and they are all available at AutoAlert," adds Richard.

Traditional systems require an expensive tracking unit and use of a central tracking service with a high monthly subscription fee, but this system is different. It requires only a unit, iPhone or iPad to get up to the minute individual and vehicle locations, alerts and comprehensive management reports.
